NEW QUESTION: 1

Which solution helps customers gain visibility into their BYOD traffic?

- A. QoS enforcement
- B. Cisco AVC application classification
- C. WAN optimization
- D. Intelligent path selection

Answer: B

NEW QUESTION: 2

The configuration allows a wired or wireless network interface controller to pass all traffic it receives to the central processing unit (CPU), rather than passing only the frames that the controller is intended to receive.

Which of the following is being described?

- A. multi-cast mode
- B. WEM
- C. promiscuous mode
- D. port forwarding

Answer: C

Explanation:

Explanation/Reference:

Promiscuous mode refers to the special mode of Ethernet hardware, in particular network interface cards (NICs), that

allows a NIC to receive all traffic on the network, even if it is not addressed to this NIC. By default, a NIC ignores all traffic that is not addressed to it, which is done by comparing the destination address of the Ethernet packet with the hardware address (a.k.a. MAC) of the device. While this makes perfect sense for networking, non-promiscuous mode makes it difficult to use network monitoring and analysis software for diagnosing connectivity issues or traffic accounting.
