Answer:

Explanation:

Explanation:

IP forwarding enables the virtual machine a network interface
 is attached to:
 Receive network traffic not destined for one of the IP
 addresses assigned to any of the IP configurations assigned to
 the network interface.
 Send network traffic with a different source IP address than
 the one assigned to one of a network interface's IP
 configurations.

The setting must be enabled for every network interface that is attached to the virtual machine that receives traffic that the virtual machine needs to forward. A virtual machine can forward traffic whether it has multiple network interfaces or a single network interface attached to it.

Box 1: Yes

The routing table allows connections from VM3 to VM1 and VM2. And as IP forwarding is enabled on VM3, VM3 can connect to VM1.

Box 2: No

VM3, which has IP forwarding, must be turned on, in order for VM2 to connect to VM1.

Box 3: Yes

The routing table allows connections from VM1 and VM2 to VM3. IP forwarding on VM3 allows VM1 to connect to VM2 via VM3.
