NEW QUESTION: 1

Which of the following are examples of business transactions in SAP CRM?

There are 3 correct answers to this question.

Response:

- A. Rebate agreements
- B. Call lists
- C. Appointments/meetings
- D. Campaigns
- E. Service confirmations

Answer: A,C,E

NEW QUESTION: 2

A company uses Azure Resource Manager (ARM) templates to deploy virtual machines (VMs).

You plan to include the following JSON segment in the ARM template.

You need to provide monitoring and diagnostics capabilities for the VM.

Which additional parameter should you include in the template?

- A. existingdiagnosticsStorageAccountName
- B. instanceCount
- C. condition
- D. instanceSize

Answer: A

Explanation:

Explanation

The diagnostics extension json snippet above assumes two parameters

existingdiagnosticsStorageAccountName and

existingdiagnosticsStorageResourceGroup to specify the

diagnostics storage account where diagnostics data is stored.

Specifying the diagnostics storage account as a parameter makes it easy to change the diagnostics storage account across different environments, for example you may want to use a different diagnostics storage account for testing and a different one for your production deployment.

NEW QUESTION: 3

DRAG DROP

You need to ensure that customer data is secured both in transit and at rest.

Which technologies should you recommend? To answer, drag the appropriate technology to the correct security requirement.

Each technology may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Answer:

Explanation:

* Azure Rights Management service

Azure Rights Management service uses encryption, identity, and authorization policies to help secure your files and email, and it works across multiple devices—phones, tablets, and PCs. Information can be protected both within your organization and outside your organization because that protection remains with the data, even when it leaves your organization's boundaries.

* Transparent Data Encryption

Transparent Data Encryption (often abbreviated to TDE) is a technology employed by both Microsoft and Oracle to encrypt database files. TDE offers encryption at file level. TDE solves the problem of protecting data at rest, encrypting databases both on the hard drive and consequently on backup media.

* TLS/SSL

Transport Layer Security (TLS) and its predecessor, Secure Sockets Layer (SSL), are cryptographic protocols designed to provide communications security over a computer network. They use X.509 certificates and hence asymmetric cryptography to authenticate the counterparty with whom they are communicating, and to negotiate a symmetric key.
