However, our C_ARCON_2102 training materials can offer better condition than traditional practice materials and can be used effectively, Same type as the certification exams, C_ARCON_2102 exam preparation is in multiple-choice questions (MCQs).

Our C_ARCON_2102 exam products will make you pass in first attempt with highest scores.

NEW QUESTION: 1

Identify the three components that serve a purpose only in the Database Machine.

- A. ASM intelligent Data Placement (IDP)
- B. Database Filesystem (DBFS)
- C. I/O Resource Manager (IORM)
- D. Database Resource Manager (DBRM)
- E. The DISKMON process
- F. Intelligent Database Protocol (IDB)

Answer: A,C,F

Explanation:

Explanation/Reference:

Intelligent Data Placement, a feature of ASM that allows placing data in such a way that more frequently accessed data is located close to the periphery of the disk where the access is faster.

The Exadata software is optimally divided between the database servers and Exadata cells. The database servers and Exadata Storage Server Software communicate using the iDB - the Intelligent Database protocol. iDB is implemented in the database kernel and transparently maps database operations to Exadata-enhanced operations. iDB implements a function shipping architecture in addition to the traditional data block shipping provided by the database. iDB is used to ship SQL operations down to the Exadata cells for execution and to return query result sets to the database kernel.

The inter-database I/O allocations are defined within the software in the Exadata cell and managed by the I/O Resource Manager (IORM). The Exadata cell software ensures that inter-database I/O resources are managed and properly allocated within, and between, databases.

NEW QUESTION: 2

Company ABC's SAN is nearing capacity, and will cause costly downtimes if servers run out disk space. Which of the following is a more cost effective alternative to buying a new SAN?

- A. Enable deduplication on the storage pools
- B. Implement replication to offsite datacenter

- C. Implement snapshots to reduce virtual disk size
- D. Enable multipath to increase availability

Answer: A

Explanation:

Storage-based data deduplication reduces the amount of storage needed for a given set of files. It is most effective in applications where many copies of very similar or even identical data are stored on a single disk.

It is common for multiple copies of files to exist on a SAN. By eliminating (deduplicating) repeated copies of the files, we can reduce the disk space used on the existing SAN. This solution is a cost effective alternative to buying a new SAN.

Incorrect Answers:

A: Multipathing enables multiple links to transfer the data to and from the SAN. This improves performance and link redundancy. However, it has no effect on the amount of data on the SAN.

C: Snapshots would not reduce the amount of data stored on the SAN.

D: Replicating the data on the SAN to an offsite datacenter will not reduce the amount of data stored on the SAN. It would just create another copy of the data on the SAN in the offsite datacenter.
