**NEW QUESTION: 2**

When defining which resources on the destination system the replicated item will use for an asynchronous session, which settings must be provided?

- A. Management IP Address, User Name, and Password
- B. Name, Pool, and Storage Processor
- C. Replication Mode, RPO, and Replicate To
- D. Ethernet Port, Subnet/Prefix Length, and Gateway

**Answer: C**

**NEW QUESTION: 3**

A Cisco Nexus 2000 Series Fabric Extender is connected to two Cisco Nexus 5000 Series switches via a vPC link. After both Cisco Nexus 5000 Series switches lose power, only one switch is able to power back up. At this time, the Cisco Nexus 2000 Series Fabric Extender is not active and the vPC ports are unavailable to the network.

Which action will get the Cisco Nexus 2000 Series Fabric Extender active when only one

Cisco Nexus 5000 Series switch is up and active?

- A. Power off and on the Cisco Nexus 2000 Series Fabric Extender so that it can detect only one Cisco Nexus 5000 Series switch at power up.
- B. Move the line from the failed Cisco Nexus 5000 Series switch to the switch that is powered on, so the port channel forms automatically on the switch that is powered on.
- C. Configure reload restore or auto-recovery reload-delay on the Cisco Nexus 5000 Series switch that is powered on.
- D. Shut down the peer link on the Cisco Nexus 5000 Series switch that is powered on.

**Answer: C**

Explanation:

The vPC consistency check message is sent by the vPC peer link. The vPC consistency check cannot be performed when the peer link is lost. When the vPC peer link is lost, the operational secondary switch suspends all of its vPC member ports while the vPC member ports remain on the operational primary switch. If the vPC member ports on the primary switch flaps afterwards (for example, when the switch or server that connects to the vPC primary switch is reloaded), the ports remain down due to the vPC consistency check and you cannot add or bring up more vPCs.

Beginning with Cisco NX-OS Release 5.0(2)N2(1), the auto-recovery feature brings up the vPC links when one peer is down. This feature performs two operations:

\*

If both switches reload, and only one switch boots up, auto-recovery allows that switch to assume the role of the primary switch. The vPC links come up after a configurable period of time if the vPC peer-link and the peer-keepalive fail to become operational within that time.

If the peer-link comes up but the peer-keepalive does not come up, both peer switches keep the vPC links down. This feature is similar to the reload restore feature in Cisco NX-OS Release 5.0(2)N1(1) and earlier releases. The reload delay period can range from 240 to 3600 seconds.

\*

When you disable vPCs on a secondary vPC switch because of a peer-link failure and then the primary vPC switch fails, the secondary switch reenables the vPCs. In this scenario, the vPC waits for three consecutive keepalive failures before recovering the vPC links.

#### **NEW QUESTION: 4**

Your network contains one Active Directory domain named contoso.com. The domain contains 2,000 client computers used by students.

You recently discover an increase in calls to the helpdesk that relate to security policy to meet the following requirement: Modify the UserName of the built-in account named Administrator

Support a time mismatch between client computers and domain controllers of up to three minutes.

Which Two security settings should you modify?

- A. Account Lockout Policy
- B. Password Policy
- C. Kerberos Policy
- D. Local Policies
- E. Security Options
- F. Account Policies
- G. Audit Policy
- H. User Rights Assignment

**Answer: C,E**

Explanation:

Explanation/Reference:

Explanation:

In Group Policy Object Editor, click Computer Configuration, click Windows Settings, click Security Settings, click Local Policies, and then click Security Options.

In the details pane, double-click Accounts: Rename administrator account.
